

# Oil and imported commodities prices

## General overview

The National Institute of Statistics and Economic Studies calculates every month an index of imported commodity prices (excluding energy). This index reflects the trend of the major imported (by France) commodities markets. Furthermore, the National Institute of Statistics and Economic Studies publishes prices for each commodity. Prices are in foreign currencies (mainly US dollars USD) and in euros (see table1).

Simultaneously, the National Institute of Statistics and Economic Studies publishes the price of North Sea crude oil (Brent) listed at London, and prices of refined products: heavy fuel listed in Rotterdam, gasoline from the American Department of Energy (DoE), and gasoil listed at InterContinental Exchange in New York. Naphta price is from the Chicago Mercantile Exchange (CME) (see table2).

## Methodology

Commodity prices are mostly spot prices (quantity purchased for immediate delivery which is different from forward contracts). These are reference prices for the market. However, some commodities are negotiated on the basis of forward contracts (futures). This is the case of wheat, sugar, cocoa, corn, arabica, tin, palladium, naphta and gasoil. Non-ferrous metals are negotiated at the London Metal Exchange and are purchase prices (except for Tin). Quotations for gold and silver are fixing prices (discontinuous quotations).

Prices are monthly means of quotations in foreign currency (mostly US dollar), converted in euro terms. It is either monthly prices covering the period or monthly mean of daily quotations (closing session).

Based in 2010=100, indexes of commodity prices imported by France are Laspeyres chained indices. Weights used for indices aggregation depict the share of each commodity (excluding energy) in French importations of the previous year. They are computed in March every year.

At last, The National Institute of Statistics and Economic Studies rebroadcasts indices of commodities prices from other institutes (see table 3)..

The constitution of indices is detailed in the table4.

## Sources

Prices of each commodity are collected by external providers on the major world markets (table1).

Brent oil (from the name of an oil field in North Sea), quoted on the free market “*InterContinental Exchange*” of London stock exchange, is reference crude oil of European supply.

The free market of refined product in Rotterdam reflects trend in dollar prices in international transactions. Since the deregulation in fuel prices in 1985, these quotations have become important in oil pre-tax price formation in France.

## Dissemination

Every month, an « Information Rapide » is released, and clusters the set of imported commodities prices index, as well as oil and derivatives prices, in foreign currencies and in euros. The publication is available on Insee website:

<https://www.insee.fr/en/statistiques?debut=0&theme=35&collection=5&idfacette=1>

Data of historical series are available on the macroeconomic database (BDM) of Insee: <https://www.insee.fr/en/statistiques/series/105299226>

Identifiers related to each commodity are noted in every table.

(1) Identification code of the product in the Macroeconomic data bank (BDM)

An oil barrel amounts to around 159 litres.

One pound weighs 0.454 kg.

One ounce weighs 31.1034768 g.

One inch is equivalent to 2.54cm.

One bushel is equivalent to 60 pounds or 26 kg.
