Main Indicators

■ Quarterly national accounts – Detailed figures Q2 2018

Households' purchasing power went up in Q2 (+0.7% after -0.5%)

In Q2 2018, GDP in volume terms* grew at the same rate as in Q1: +0.2%. Household consumption expenditures faltered slightly (-0.1% after +0.2%), whereas total gross fixed capital recovered sharply (GFCF: +0.8% after +0.1%). Overall, final domestic demand excluding inventory contributed as much to GDP growth as in Q1 (+0.2 points).

Imports bounced back during this quarter (+0.7% after -0.6%), as did exports to a lesser extent (+0.1% after -0.4%). All in all, foreign trade balance contributed negatively to GDP growth: -0.2 points after +0.1 points. Conversely, changes in inventory drove GDP on (+0.2 points after -0.1 points).

Purchasing power bounced back in Q2 2018

Households' gross disposable income (HDI) grew in current euros in Q2 2018 (+1.1% after +0.1%). The gross payroll growth slowed down slightly (+0.7% after +0.9%), but was balanced by a decrease in the taxes on income and wealth. This decrease has been due to the substitution of the wealth tax (ISF), by the property tax (IFI). Households' social benefits growth has remained constant (+0.5% during both quarters).

Households' consumption prices slowed down slightly in Q2 (+0.4% after +0.6%), mainly because the energy prices increased slowly, so that the purchasing power bounced back clearly in Q2 (+0.7% after -0.5%). When measured per consumption unit, it has also recovered (+0.6% after -0.6%). Households' consumption decreased a bit (-0.1% after +0.2%), while purchasing power grew. As a result, the saving rate went up: it stood at 14.3% after 13.7% in Q2 2018.

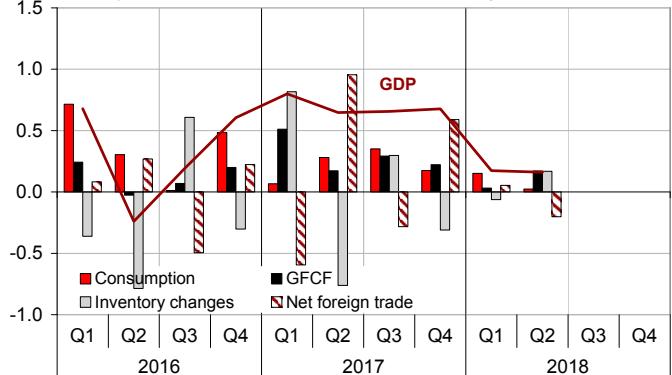

Non-financial corporations' profit ratio decreased

In Q2 2018, non-financial corporations' profit ratio decreased at 31.5% (after 32.0%). It is due to the decline of productivity gains, the slight rebound of real wages and the further deterioration of the terms of trade.

are chain-linked previous-year-prices volumes.

More

The statistical overhang of a variable is the annual growth rate which would be obtained if this variable was to remain at its level of the last known quarter.

General government deficit increased slightly in Q2 2018

In Q2 2018, general government net borrowing increased a little (+0.1 points): the public deficit stands at 2.5% of the GDP after 2.4% in Q1 2018.

General government expenditure declined slightly in Q2 (-0.2% after +0.6%). Indeed, the amounts paid to businesses to refund the 3% tax on dividends still decreased. Moreover, both the French contribution to the European budget and subsidies slowed down after a dynamic Q1, mainly due for the latter to the increase in CICE regarding wages paid in 2017.

Government receipts declined (-0.3% after +0.1%), mostly because of the decrease in the taxes on income and wealth. This decrease is due to a cut of the corporate income tax rate for income up to 500,000€ and the substitution of the wealth tax (ISF) by the property tax (IFI).

Revisions

GDP growth estimate for Q1 2018 is confirmed at +0.2%. Slight revisions in different aggregates offset each other; they are mainly due to the revision of indicators and to the update of seasonal adjustment coefficients. The purchasing power growth for Q1 is revised by +0.1 points, mainly due to an increase in dividends received by households.
